

1. An evaporative stand-alone cooling device comprising:

(a) a housing having a multiple of open vertical sides including wettable evaporative pads placed in each of said openings of said open vertical sides;

(b) means for delivering water to each top of said evaporative pads to flow downwardly through said pads by gravity;

(c) a sump located at the bottom of said housing to collect excess water therein from said evaporative pads;

(d) a pump placed in said sump being the said means for delivering water to the top of each of the pads and a float is located in said sump to detect a minimum level of water in said sump to stop said pump;

(e) said housing further including a centrifugal blower driven by a first electric motor, said blower being mounted in said housing so as to create a positive pressure of vertically flowing air while at the same time creating a negative pressure of laterally flowing air through said evaporative pads.

(f) said housing further including a cover at its top having an opening to accommodate said vertically flowing air; and

(g) means for driving an oscillating and rotatable spout being placed over said opening to direct air in multiple directions.

2. The evaporative cooling device of claim 1, wherein each of said evaporative pads is of a sandwich construction consisting of said evaporative pad being placed innermost in each of said open vertical sides and a grid being placed most outwardly in said in said open vertical sides to protect said evaporative pad from damage and to enhance the aesthetic appearance of said housing.

3. The evaporative cooling device of claim 1, wherein said first electric motor is a direct drive motor.

4. The evaporative cooling device of claim 1, wherein said first electric motor is a belt drive motor.

5. The evaporative cooling device of claim 1 including a water connection in said sump for delivering water into said sump.

6. The evaporative cooling device of claim 5, wherein said water connection is connected to a water valve device including a float to detect a maximum of water level in said sump to shut off the water supply.

7. The evaporative cooling device of claim 1, wherein a drainage plug is provided in the bottom of said sump.

8. The evaporative cooling device of claim 1, wherein a movable access door is provided in one of said evaporative pads to be able to gain access to the interior of said housing.

9. The evaporative cooling device of claim 1, wherein vertical supports are placed in each corner of said multi-sided housing and wherein the tops of said supports are connected by channel braces which are open at their bottom and water dripping pipes are placed and concealed within said channels.

10. The evaporative cooling device of claim 1, wherein said spout has a circular bottom ring and said top cover has a circular recess receiving said ring including means for clamping said spout in any adjusted rotational position.

11. The evaporative cooling device of claim 10, wherein said means for clamping consists of a knob at the top of said spout being connected to a downwardly extending threaded bolt, the end of which is being received in a NYLON lock nut having been mounted in the top of said housing.

12. The evaporative cooling device of claim 1, wherein said spout has a rectangular opening and an adapter is placed over said opening to convert the same to circular opening including a circular and flexible air duct attached to said circular opening.

13. The evaporative cooling device of claim 1 including an electric rotary switch mounted on said housing to control the speed of said pump and said blower singly or in combination.

14. The evaporative cooling device of claim 1 including casters placed at the bottom of said housing to be moved relative to a supporting surface.

15. The evaporative cooling device of claim 1, further comprising a second electric motor and a linkage between said second motor and said oscillating and rotatable spout, said linkage being adapted to rotate said oscillating rotatable spout alternatively clockwise or counterclockwise.

16. The evaporative cooling device of claim 15, wherein said linkage further comprises a rotating block having a first end and a second end being connected to said second electric motor at said first end, a socket formed in said second end, a ball loosely engaged in said socket, a rod connected to said ball at a first end of said rod, the second end of said rod being connected to a secondary ball loosely engaged in a secondary socket, said secondary socket being attached to a cross member being attached to said oscillating, rotatable spout.

17. An evaporative stand-alone cooling device comprising:

(a) a housing having a multiple of open vertical side including wettable evaporative pads placed in each of said openings of said vertical sides;

(b) means for delivering water to each top of said evaporative pads to flow downwardly through said pads by way of gravity;

(c) a sump is located at the bottom of said housing to collect excess water therein from said evaporative pads;

(d) a pump is placed in said sump being the said means for delivering water to the top of each of said pads and a float is located in said sump to detect a minimum level of said water in said sump to stop the pump;

(e) said housing further including a centrifugal blower being driven by a first electric motor, said blower being mounted in said housing so as to create a positive pressure of vertically flowing air while at the same time creating a negative pressure of laterally flowing air through said evaporative pads;

(f) said housing further includes a cover at its top having an opening to accommodate said vertically flowing air;

(g) an oscillating, rotatable spout is being placed over said opening to direct air in multiple directions; and

(h) further comprising a second electric motor and a linkage between and second electric motor and said oscillating, rotatable spout, said linkage being adapted to rotate said oscillating rotatable spout alternatively clockwise and counterclockwise.

(i) wherein each of said evaporative pads is of a sandwich construction consisting of said evaporative pads being placed innermost in each of said vertical open sides and a grid placed most outwardly in said open vertical sides to protect said evaporative pad from damage and to enhance the aesthetic appearance of the housing.
